

We are looking for talented students to pursue an MSc degree in our lab

Projects include:

1. Environmental microbiology and oceanography to study

The role of rhodopsin phototrophy in ocean's solar energy capture and its regulation in contrasting nutrient regimes.

2. Host-microbe interactions to study

The molecular mechanisms underlying the acquisition and maintenance of bacteria symbionts in marine sponges.

These studies are part of international collaborations with research groups in the USA, Germany, Australia, Holland and Italy.
